Methodical Troubleshooting Approach

1. Prerequisite: Know the Sequence of Operation for the system in question

2. If possible, validate the complaint/observation on the BAS

3. Is this variable in question being controlled for?
   i. If not, is there another variable that correlates to it?

4. Investigate that control loop
   i. Is setpoint appropriate?
   ii. Is controller response as expected?
   iii. Is the manipulated variable as expected?

5. What other variable could be causing the issue? Repeat Steps 3 and 4 for this variable

6. Continue working your way back until you find something out of place
